

# How to use Bokashi Soil Enhancer

## Beneficial Microbial Inoculant for Garden and Horticultural Soils.

Soil Enhancer is a mixture of plant based by-products and other added nutrients fermented with EM (Effective Micro-Organisms)

Usage of Soil Enhancer has been shown to:

- Release nutrients from the soil
- Increase soil microbial activity
- Improve soil structure and water holding capacity
- Increase photosynthetic capacity of plants
- Suppress soil borne pathogens and pests
- Improve plant growth

It can be used over bare soil, crop debris or as a side dressing around or in between crop rows and plant

## Directions for Use:

Spread 1-2 handfuls of soil enhancer over bare ground, a green crop, or crop residues and incorporate into the soil.

Or Drizzle 1-2 handfuls along rows or between plants and lightly incorporate into the soil.

*The stimulation of microbial activity means that the soil is able to degrade plant residues more rapidly releasing nutrients and improving organic matter quality.*

Onions grown using Soil Enhancer previously applied to a green cover crop and side dressing following crop establishment.

The addition of a broad spectrum mineral mixture such as rock dust or seaweed meal will assist in re-mineralizing mineral depleted soils. Apply at 1 - 2 handfuls per square metre.
